

ENACT HACKATHON · SETUP

Installing Eclipse IDE & the ENACT SDK

A step-by-step guide to get your development environment ready — install the Eclipse IDE, then add the ENACT Software Development Kit from either the Eclipse Marketplace or the p2 update site.

~15 minutes

Java 21+

Eclipse 2025-12 (4.38)+

Windows · Linux · macOS

What you'll do

1. Check prerequisites
2. Install the Eclipse IDE
3. Install the ENACT SDK
4. Option A — Eclipse Marketplace
5. Option B — p2 update site
6. Verify the installation

BEFORE YOU START

0 Prerequisites

The ENACT SDK is an Eclipse plug-in suite. You need a recent Eclipse IDE and a Java 21 (or newer) runtime. Everything else is installed through this guide.

COMPONENT	REQUIREMENT	NOTES
Java Runtime	21 or newer	The Eclipse Installer can provision one for you (it currently ships a Java 25 JRE). Otherwise get it from adoptium.net .
Eclipse IDE	2025-12 (4.38) or newer	Installed in Step 1 below.
Operating system	Windows, Linux, or macOS	<code>x86_64</code> or <code>aarch64</code> (Apple Silicon).
AI Assistant (optional)	Local Ollama + a tool-capable model	Only needed if you'll use the AI Assistant module (7B+ model, e.g. <code>qwen2.5</code>).

Already have Eclipse installed?

If your Eclipse is **2025-12 (4.38) or newer** on Java 21+, skip straight to Step 2 — Install the ENACT SDK.

PART ONE

1 Install the Eclipse IDE

The quickest route is the official Eclipse Installer, which downloads and sets up a ready-to-use IDE package.

1 Download the Eclipse Installer

Go to eclipse.org/downloads and open the **Download** menu, then choose the build for your machine — [Download x86_64](#) for most PCs, or [Download AArch64](#) for Apple Silicon / ARM. This downloads the **Eclipse Installer**.

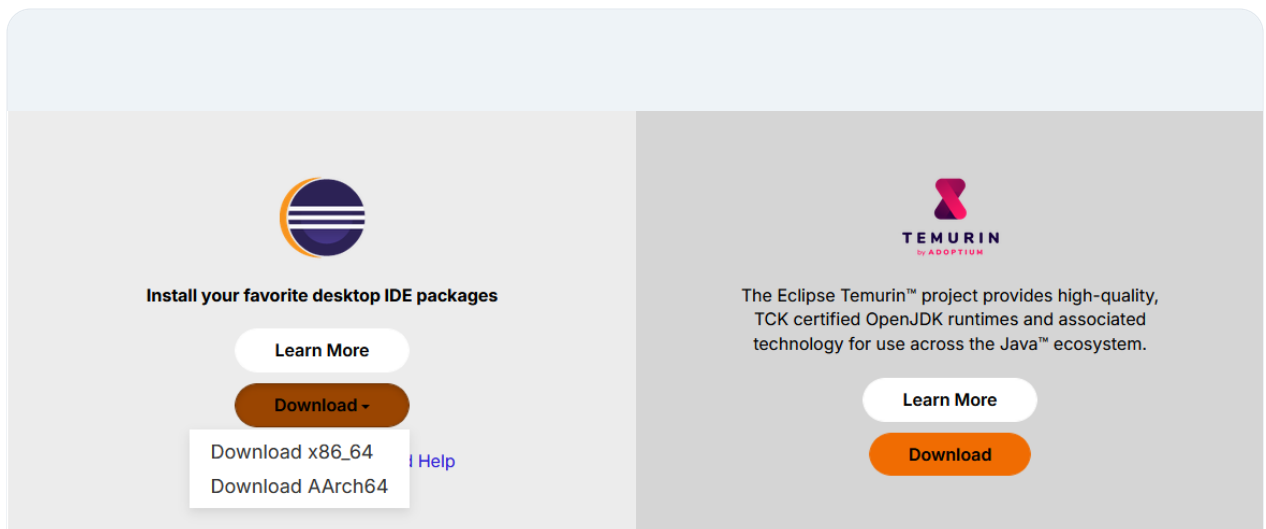

Figure 1. The Eclipse downloads page — expand **Download** and pick **x86_64** or **AArch64**.

2

Pick the “Eclipse IDE for Java Developers” package

Launch the downloaded installer. From the list of packages, select “**Eclipse IDE for Java Developers**” — it includes everything the ENACT SDK needs.

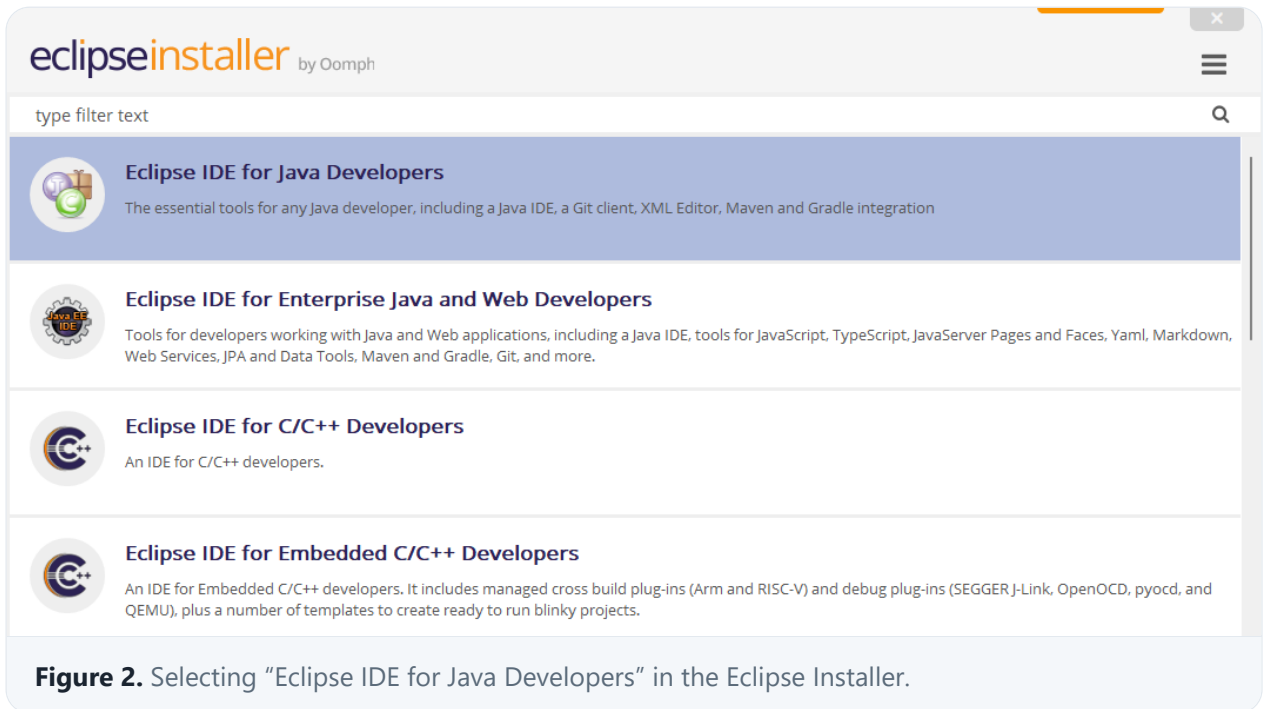

Figure 2. Selecting “Eclipse IDE for Java Developers” in the Eclipse Installer.

3

Choose the Java VM and install folder

Confirm the Java VM the installer offers (a suitable Java 21+ JRE — the current installer ships Java 25), pick an **Installation Folder**, and click **INSTALL**. Accept the license agreement when prompted.

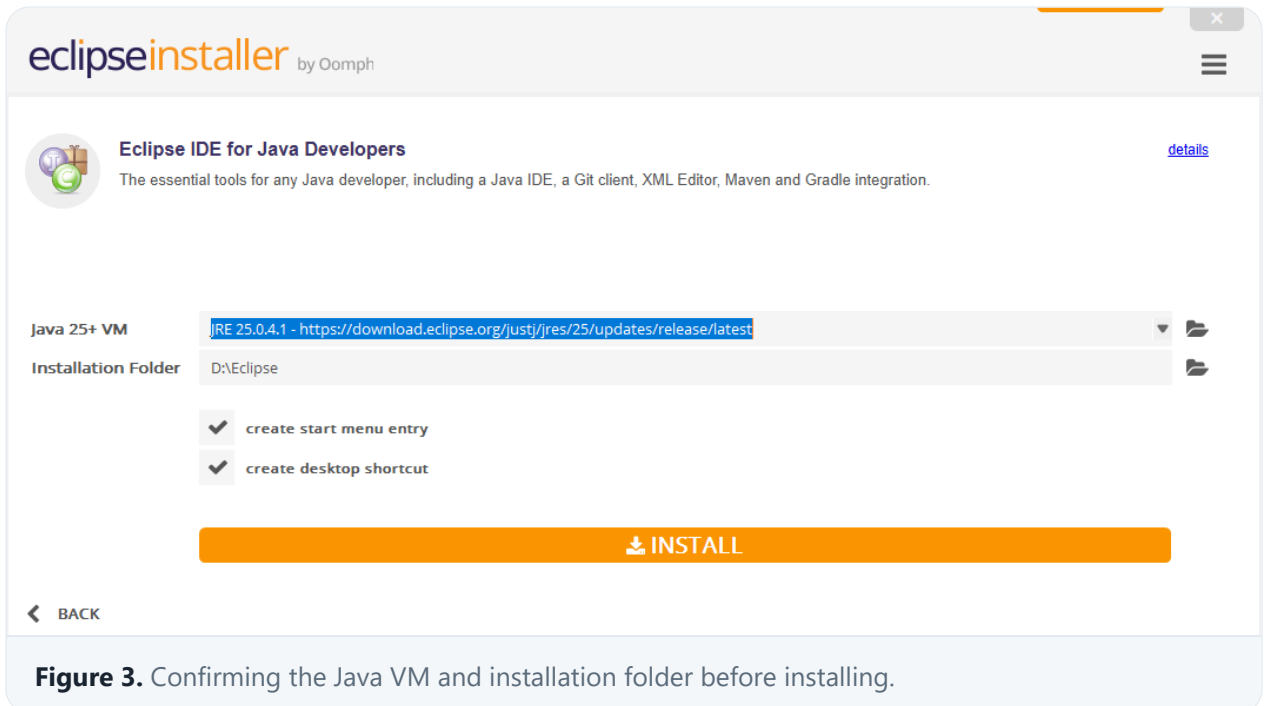

Figure 3. Confirming the Java VM and installation folder before installing.

4

Launch Eclipse and choose a workspace

Click **Launch** when the install finishes. Eclipse asks for a **workspace** folder — this is where your projects live. Accept the default or pick your own, then click **Launch**.

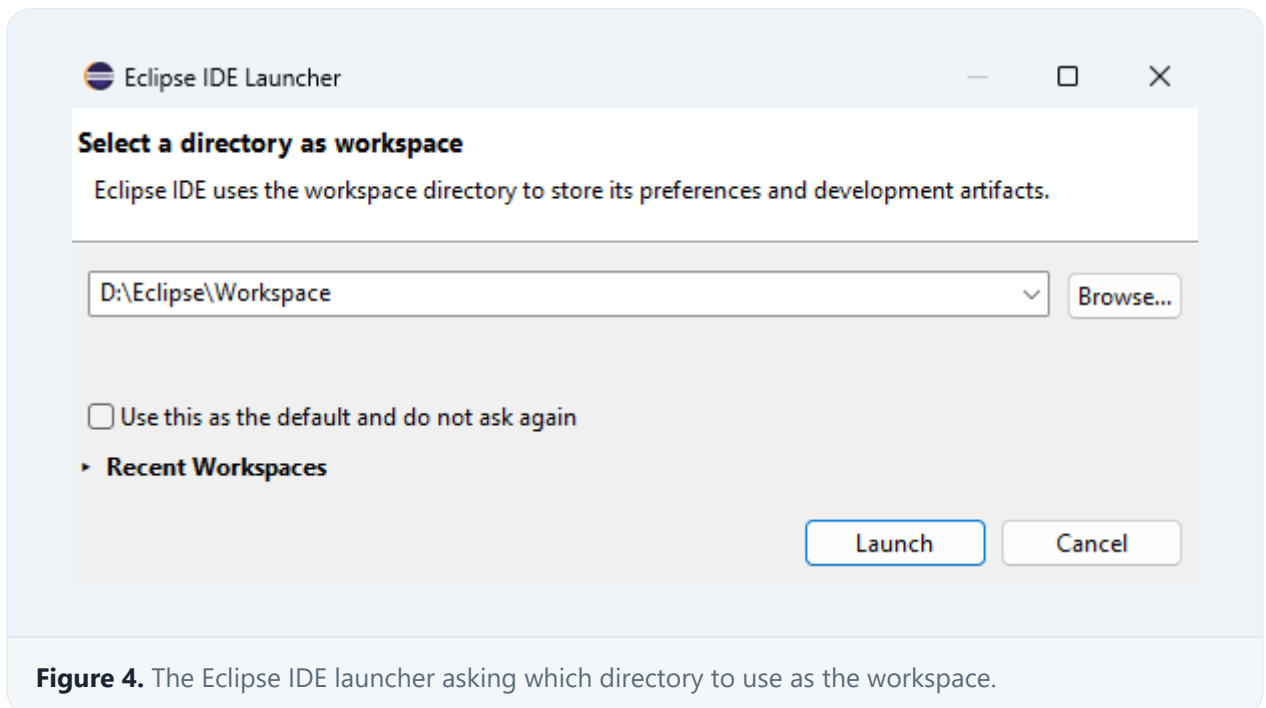

Figure 4. The Eclipse IDE launcher asking which directory to use as the workspace.

Verify your Eclipse version

Open **Help** → **About Eclipse IDE**. Confirm the version is **2025-12 (4.38)** or newer. If it's older, update Eclipse before installing the SDK.

PART TWO

2 Install the ENACT SDK

There are two ways to install the SDK. Both install the **complete SDK** (all modules); you can deselect optional modules in the install wizard before finishing. Pick whichever you prefer.

RECOMMENDED

Option A — Eclipse Marketplace

Search & click Install from inside Eclipse.
Easiest for most people. → Go to Option A

Option B — p2 update site

Add the update-site URL manually via "Install New Software". → Go to Option B

Option A — Eclipse Marketplace

1 Open the Eclipse Marketplace

In the menu bar, choose **Help** → **Eclipse Marketplace...**

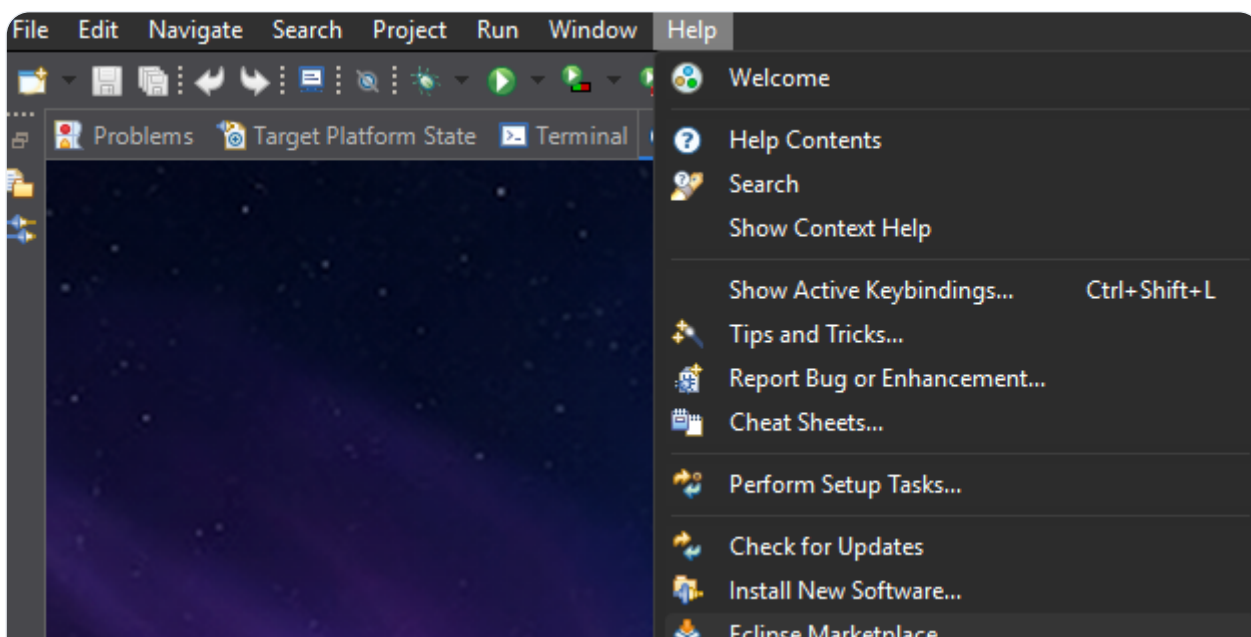

Figure 5. Opening the Eclipse Marketplace from the Help menu.

2

Search for the ENACT SDK and click Install

Type **ENACT** in the **Find** box and press **Enter**. Locate **“ENACT Software Development Kit”** (by Siemens, Apache 2.0) in the results and click **Install**.

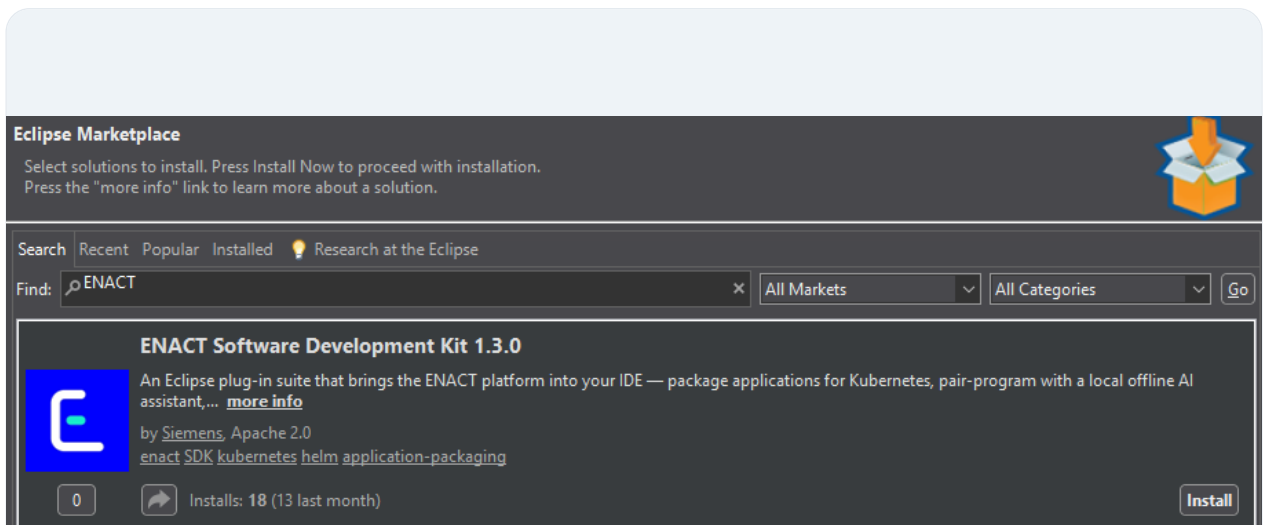

Figure 6. The ENACT Software Development Kit entry in the Marketplace search results, with its **Install** button.

3

Confirm the features, accept the license, and restart

Review the selected features (the **complete SDK** is pre-selected) and click **Confirm**. On the **Review Licenses** page, accept the **Apache 2.0** license and click **Finish**. When the **unsigned content** warning appears, choose **Install anyway / Trust Selected**, then **restart Eclipse** when prompted.

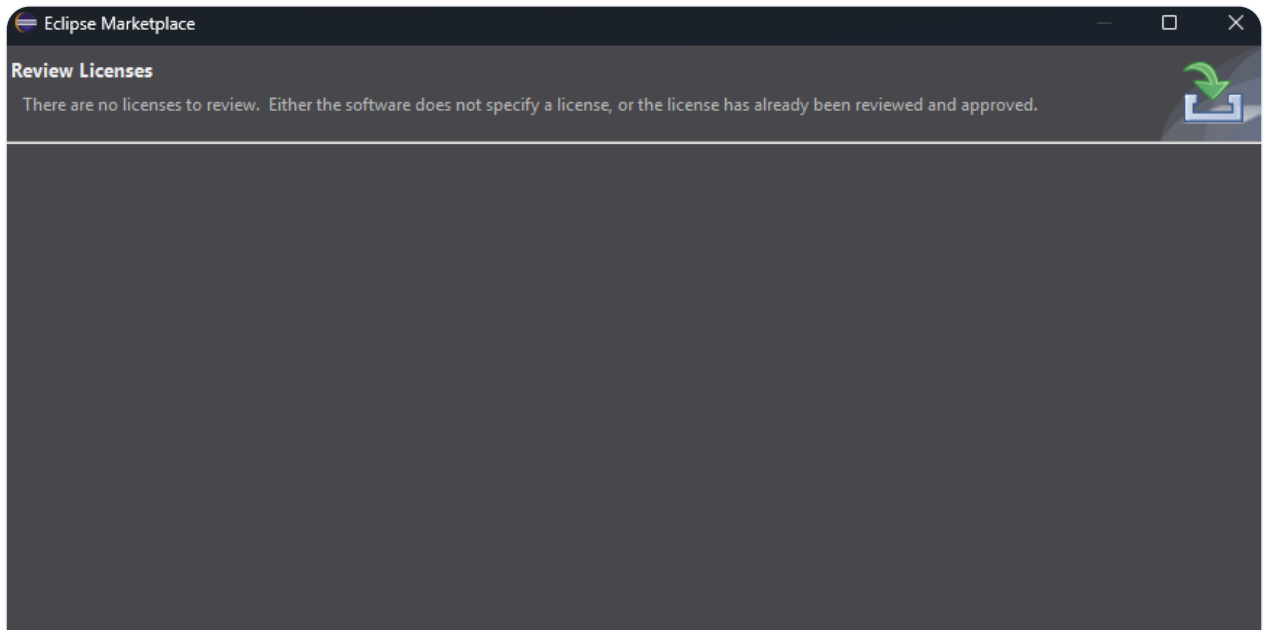

Figure 7. The **Review Licenses** page. On a fresh install the Apache 2.0 license text appears here to accept; if this machine has already accepted it, the page reads “no licenses to review” and you can click Finish.

“Warning: unsigned content” is expected

This Beta release ships unsigned JARs. It's safe to proceed for the hackathon — choose **Install anyway / Trust Selected**.

Shortcut: drag-to-install

You can also drag the **Install** button from the ENACT SDK landing page straight onto a running Eclipse workbench.

Option B — p2 update site

Use this if you'd rather add the update site by URL. This is the update-site address:

```
https://pages.eclipse.dev/eclipse-research-labs/enact-project/software-development-kit/releases/latest/
```

1 Open “Install New Software”

Choose **Help** → **Install New Software...**

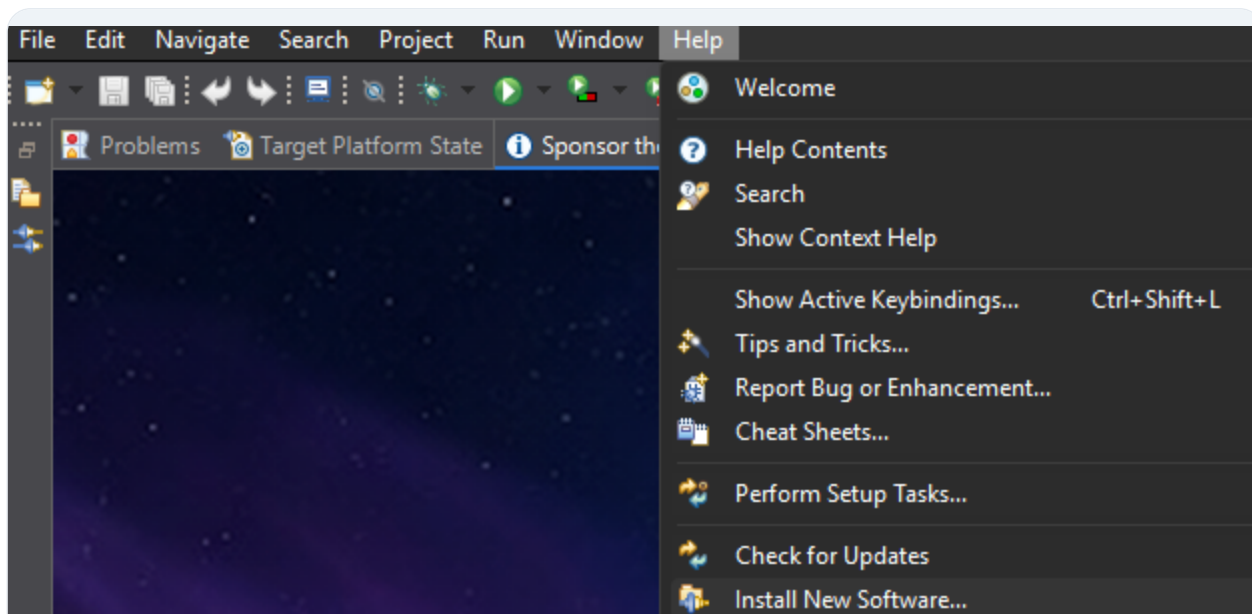

Figure 8. Opening “Install New Software...” from the Help menu.

2

Add the update site and select the complete SDK

Click **Add...** next to **Work with**, then in the **Add Repository** dialog set **Name** to **ENACT SDK** and paste the URL above into **Location**, and click **Add**. Back in the list, expand **ENACT SDK — Complete** and tick **“ENACT SDK — Complete (install everything)”**, then click **Next**.

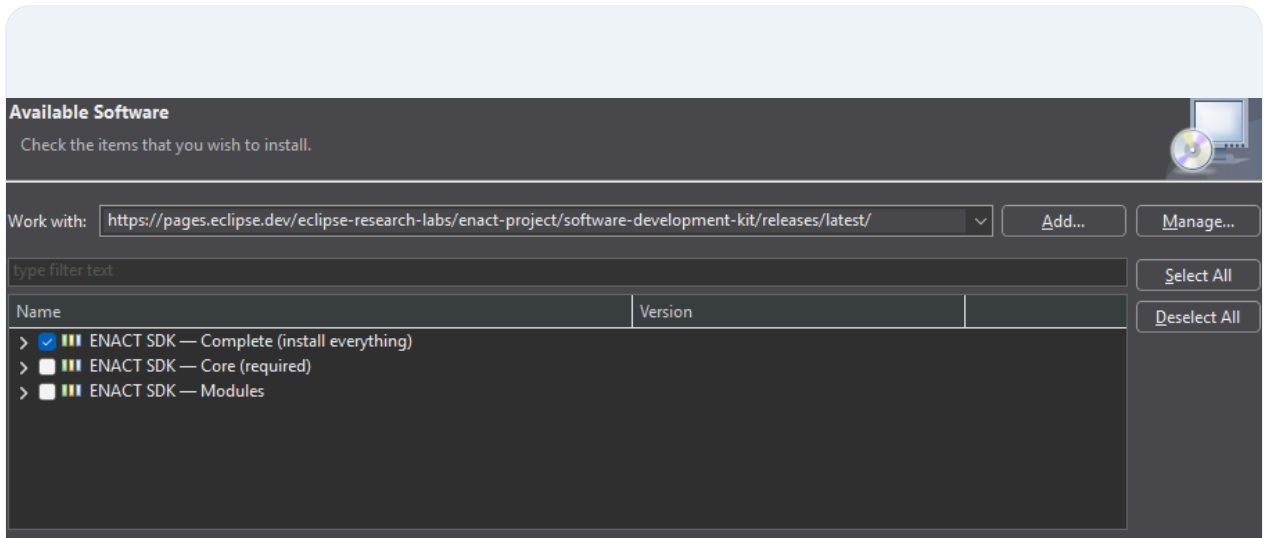

Figure 9. With the update-site URL in **Work with**, tick **ENACT SDK — Complete (install everything)**.

3

Review the install details

On the **Install Details** page you'll see the complete SDK and each module it pulls in (Core, Application Packaging, AI Assistant, Dataspaces, Application Controller, Application Policies). Click **Next**.

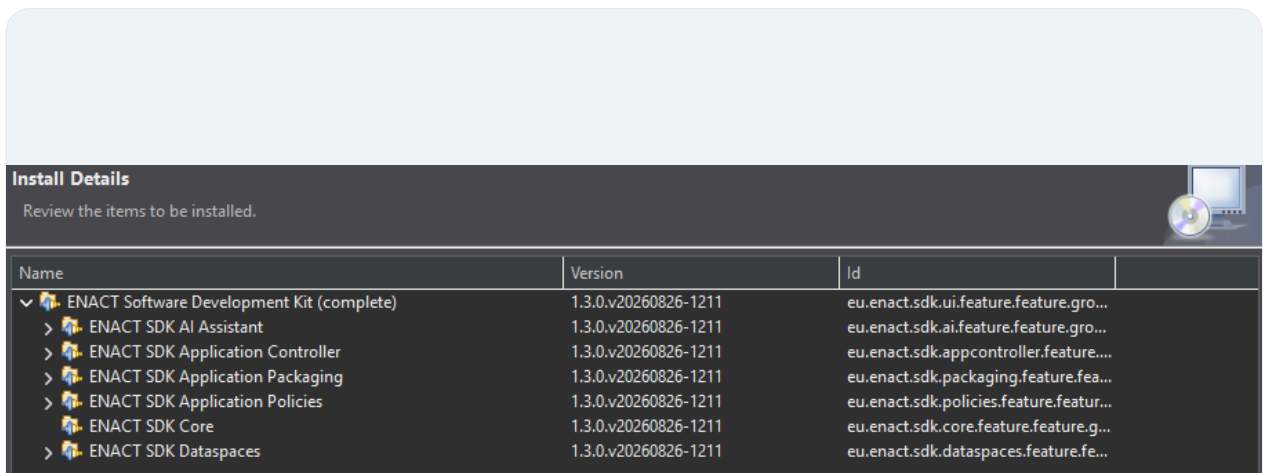

Figure 10. The Install Details page listing the complete SDK and all its modules.

4

Accept the license, trust & restart

Accept the **Apache 2.0** license and click `Finish`. If the **unsigned content** warning appears, choose `Install anyway / Trust Selected`. **Restart Eclipse** when prompted.

Want a specific version?

A pinned release is always available at `.../releases/<tag>/` — for example `.../releases/v1.3.0/` — in addition to the `latest` alias used above.

PART THREE

3 Verify the installation

After restarting, open the SDK control panel to confirm everything is in place.

1

Open the Show View menu

From the menu bar, choose **Window** → **Show View** → **Other...**

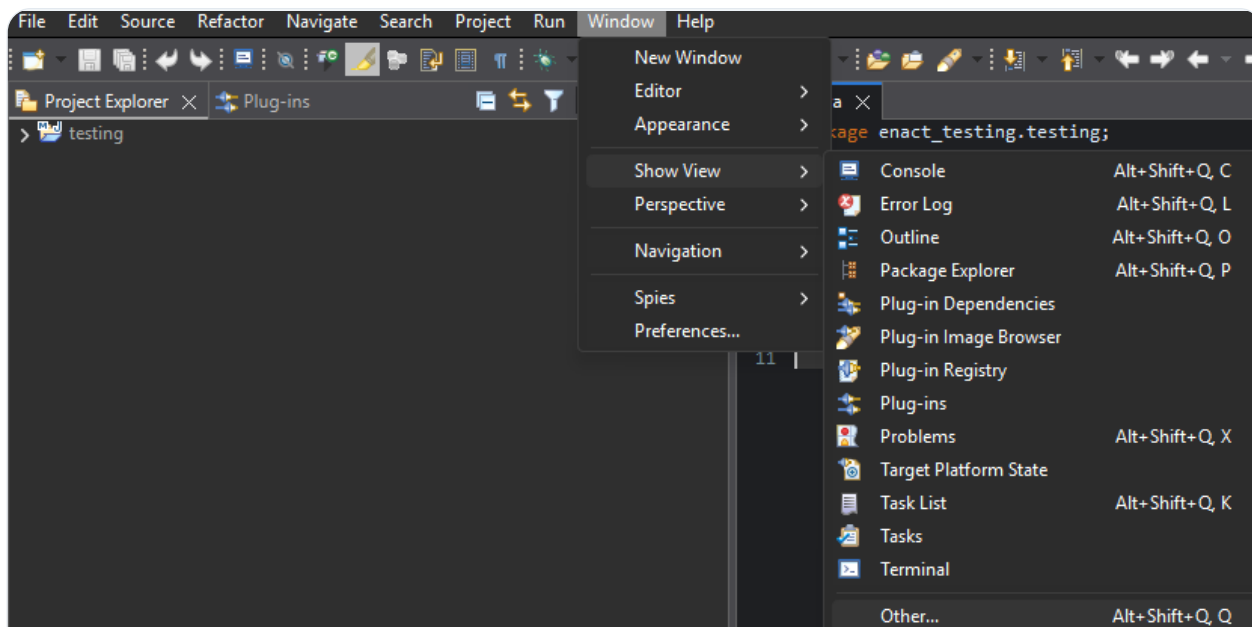

Figure 11. Opening the Show View list from the Window menu.

2

Select the SDK Control Panel

In the **Show View** dialog, expand the **ENACT SDK** category, select **SDK Control Panel**, and click **Open**.

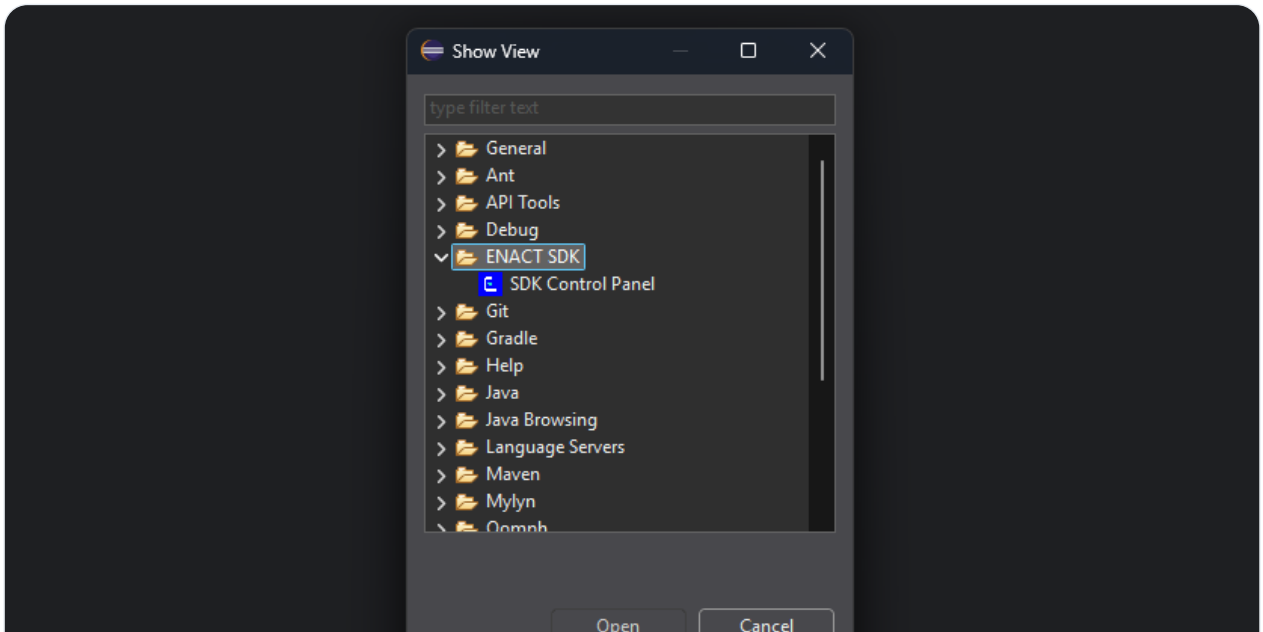

Figure 12. Selecting the SDK Control Panel view under the ENACT SDK category.

3

Confirm the SDK is running

The Control Panel opens docked to the right, with a navigation bar of module tabs — **Home**, **Application Packaging**, **Dataspaces**, and more. If not all tabs fit, use the < > arrows at the ends of the bar to page through the rest (AI Assistant, Application Controller, Application Policies). You're ready to go.

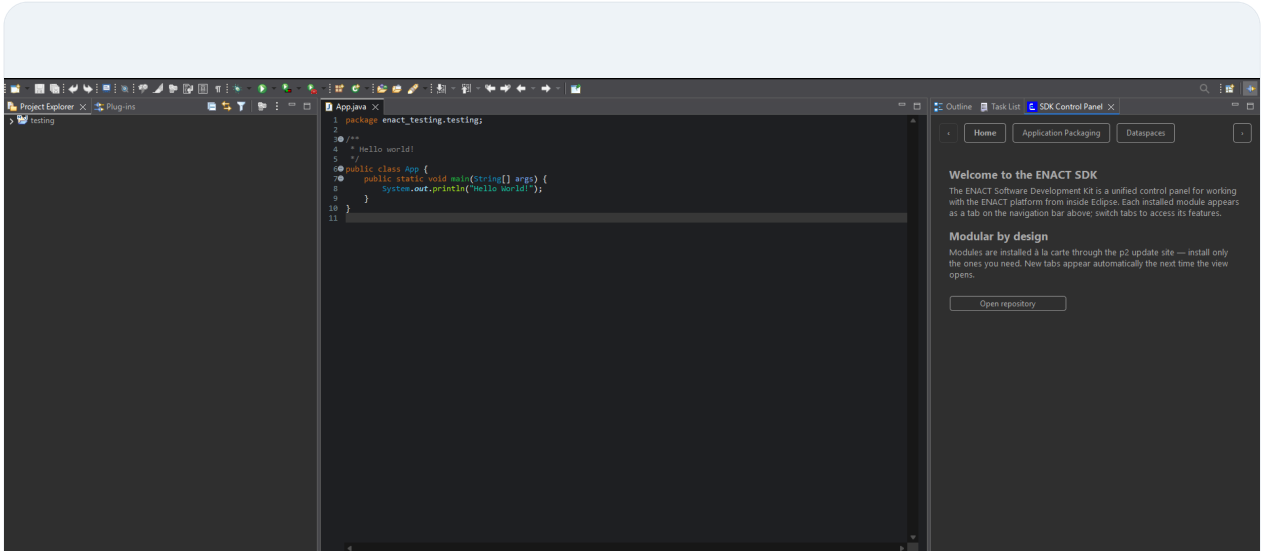

Figure 13. The SDK Control Panel docked in the workbench, showing the module navigation bar and the welcome page.

Updating later

To get new releases, run **Help** → **Check for Updates**. The SDK upgrades in place — no manual uninstall needed.

AI Assistant does nothing / can't find a model?

Make sure a local Ollama server is running and a tool-capable model is pulled (7B+, e.g. `qwen 2.5`). Smaller models may not emit tool calls reliably.
